			MAIL DATE 06/29/2007	DELIVERY MODE PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

**Office Action Summary**

Application No.

10/773,183

Applicant(s)

SILVERBROOK, KIA

Examiner

Shelby Fidler

Art Unit

2861

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 18 April 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-6,8,10-22,24,25,27,29-44 and 46-54 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-6,8,10-22,24,25,27,29-44 and 46-54 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SB/08)  
Paper No(s)/Mail Date 4/18/2007.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date: \_\_\_\_\_.
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_.

## DETAILED ACTION

### *Responsive Office Action*

This Office Action is responsive to amendments and remarks filed 4/18/2007.

### *Specification*

Amendments to the specification were received on 4/18/2007. These amendments introduce no new matter, and are acceptable.

### *Claim Objections*

Claim 17 recites the limitation "said part" in line 3 of the claim. There is insufficient antecedent basis for this limitation in the claim. A similar objection applies to claim 36.

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-5, 11-13, 16, 19-22, 24, 30-32, 35, 38-42, 47-48, 50, and 52 are rejected under 35 U.S.C. 103(a) as being unpatentable over Campbell et al. (US 4870433) in view of Sakurai et al. (US 5206659).

Regarding claims 1, 19, and 38:

Art Unit: 2861

**Campbell et al. disclose an inkjet printhead comprising:**

a plurality of nozzles (nozzles 19), each having a respective bubble forming chamber (print cavity 21; Fig. 2);

at least one heater element (resistive heater elements 12) disposed in each of the bubble forming chambers respectively (Fig. 2), the heater element being configured for thermal contact with a bubble forming liquid (col. 3, lines 8-11);

drive circuitry (electrodes 15 and 16) corresponding to each of the nozzles (col. 2, lines 57-59 and Fig. 3) for controlling the operation of the heater element (col. 3, lines 8-11);

heating the heater element to a temperature above the boiling point of the bubble forming liquid forms a gas bubble (bubble 22) that causes the ejection of a drop of an ejectable liquid through the nozzle corresponding to that heater element (col. 3, lines 8-13); wherein

part of the drive circuitry (common electrode 15) is disposed on one side of the bubble forming chamber (Figs. 1-3); and

part of the drive circuitry (individual electrode 16) is formed on the opposing side of the bubble forming chamber (Figs. 1-3), wherein

the nozzles are supplied with a replacement volume of the ejectable liquid equivalent to an ejected drop (obvious to the cyclic ejections of col. 3, lines 3-7 and col. 4, lines 64-68).

**Campbell et al. do not expressly disclose that the heater element has a bubble nucleation section of a smaller cross section than the rest of the heater element so that the temperature of the bubble nucleation section is heated to above the boiling point before the rest of the heater element.**

**However, Sakurai et al. disclose heater elements (heater arrangement 50) that have bubble nucleation sections (heating element 56) of a smaller cross section than the rest of the**

Art Unit: 2861

heater element (Fig. 5A) so that the temperature of the bubble nucleation section is heated to above the boiling point before the rest of the heater element (col. 5, lines 1-8, 19-40 and Figs. 5 and 6).

Therefore, at the time of invention, it would have been obvious to a person of ordinary skill in the art to utilize heater elements with bubble nucleation sections of a smaller cross section, such as taught by Sakuri et al., into the invention of Campbell et al. The motivation for doing so, as taught by Sakuri et al., is to provide a heater element that can withstand high heating rates while also providing a high heat flux transfer to the ink (col. 5, lines 19-46).

**Regarding claims 2, 20, and 39:**

Campbell et al. also disclose that the heater elements (12) and bubble forming chambers (21) are symmetrical about a longitudinal plane (Figs. 1-3).

**Regarding claims 3, 21, and 40:**

Campbell et al. also disclose that the bubble forming chamber (21) has a circular cross section (Fig. 1) wherein the heater element (12) has at least one arcuate section (elongated portions 31) that is concentric with the longitudinal axis of the bubble forming chamber (Fig. 3) such that during use, the arcuate section forms a disc-shaped bubble (bubble 22; col. 3, lines 50-58) with a point of collapse substantially on the central axis of the bubble forming chamber (col. 3, lines 60-64).

**Regarding claims 4, 22, and 41:**

Campbell et al. also discloses that the gas bubble (22) encircles at least some of the heater element (col. 3, lines 54-57 and Fig. 2).

**Regarding claims 5, 24, and 42:**

Campbell et al. also disclose that the bubble forming liquid and the ejectable liquid are of a common body of liquid (col. 3, lines 8-13).

Regarding claims 11, 30, and 47:

Campbell et al. also disclose that each heater element (12) has two opposite sides (e.g. top side and bottom side of Fig. 3) and is configured such that the gas bubble formed by the heater element is formed at both sides of the heater element (col. 3, lines 50-60 and Fig. 3).

Regarding claims 12, 31, and 48:

Campbell et al. also disclose that the bubble (22) is collapsible and has a point of collapse, and wherein each heater element (12) is configured such that the point of collapse is spaced from any solid surface of the heater elements (col. 3, lines 60-64).

Regarding claims 13, 32, and 50:

Campbell et al. also disclose a structure (substrate 18), wherein the nozzles (19) are incorporated on the structure (col. 3, lines 1-3 and Fig. 2).

Examiner notes the limitation that the structure is formed by chemical vapor deposition. However, this limitation pertains only to the method of forming a device, which is not germane to the patentability of the device itself or the method of using the device; therefore, Examiner has not given this limitation patentable weight.

Regarding claims 16, 35, and 52:

Campbell et al. as modified by Sakurai et al. disclose all claimed limitations except that the heater element is formed of solid material more than 90% of which, by atomic proportion, is constituted by at least one periodic element having an atomic number below 50.

Art Unit: 2861

However, Sakurai et al. disclose forming a heater element from alloys, oxides, nitrides, or borides of titanium, tantalum, tungsten, niobium, chromium, hafnium, zirconium, or nickel (col. 4, lines 65-68).

Therefore, at the time of invention, it would have been obvious to a person of ordinary skill in the art to utilize a heater element formed of Titanium Nitride (90% constituted by periodic element Titanium), such as suggested by Sakurai, into the invention of Campbell et al. as modified by Sakurai et al. The motivation for doing so, as taught by Sakurai et al., is to provide a heater element made of a material that disperses the undesirable thermal stresses that are induced in a heating element (col. 5, lines 1-8).

Claims 6, 8, 10, 14, 25, 27, 29, 33, 43-44, 46, and 49 are rejected under 35 U.S.C. 103(a) as being unpatentable over Campbell et al. as modified by Sakurai et al., as applied to claim 1 above, and further in view of Silverbrook (US 6019457).

**Regarding claims 6, 25, and 43:**

Campbell et al. as modified by Sakurai et al. disclose all claimed limitations except that the printhead is configured as a pagewidth printhead.

However, Silverbrook discloses a pagewidth printhead (head 200) configured to print on a page (col. 6, lines 7-12).

At the time of invention, it would have been obvious to a person of ordinary skill in the art to utilize a pagewidth printhead into the invention of Campbell et al. as modified Sakurai et al. The motivation for doing so, as taught by Silverbrook, is to be able to print on the width of an A4 page (col. 6, lines 7-12).

**Regarding claims 8, 27, and 44:**

Campbell et al. as modified by Sakurai et al. disclose all claimed limitations except that the heater elements are configured such that an actuation of less than 500 nJ is required to be applied to the heater elements so as to form the bubble in the bubble forming liquid to cause the ejection of the drop.

However, Silverbrook discloses heater elements (heaters 120; Fig. 10) that are configured such that an actuation energy of less than 500 nJ is required to heat the heater element sufficiently to form the bubble in the bubble forming liquid, thereby causing an ejection of the drop (200 nJ; col. 19, lines 8-9).

At the time of invention, it would have been obvious to a person of ordinary skill in the art to utilize heater elements that require less than 500 nJ to heat the heater element to eject a drop into the invention of Campbell et al. as modified by Sakurai et al. The motivation for doing so, as taught by Silverbrook, is to allow power dissipation to be reduced without affecting print speed (col. 19, lines 9-10).

Regarding claims 10, 29, and 46:

Campbell et al. as modified by Sakurai et al. disclose all claimed limitations except that the substrate surface has an areal density of nozzles exceeding 10,000 nozzles per square centimeter of substrate surface.

However, Silverbrook discloses a substrate surface wherein the areal density of the nozzles relative to the substrate surface exceeds 10,000 nozzles per square centimeter of substrate surface (using the reference measurement of Figure 43 and counting the individual nozzles disclosed in the "part of cyan" section of Figure 43, calculations show that the density

exceeds 10,000 per square centimeter:  $\frac{20 \text{ nozzles}}{0.0016384 \text{ cm}^2} = 12207 \frac{\text{nozzles}}{\text{cm}^2}$  ).

Art Unit: 2861

At the time of invention, it would have been obvious to a person of ordinary skill in the art to utilize a printhead substrate surface with a nozzle density of 10,000 nozzles per square centimeter into the invention of Campbell et al. as modified by Sakurai et al. The motivation for doing so, as taught by Silverbrook, is to provide four nozzles per pixel which would give up to 16 drops per pixel (co. 16, lines 60-62).

**Regarding claims 14, 33, and 49:**

Campbell et al. as modified by Sakurai et al. disclose all the limitations of claim 1, and Campbell et al. also disclose a structure (substrate 18), wherein the nozzles (19) are incorporated on the structure (col. 3, lines 1-3 and Fig. 2).

Campbell et al. as modified by Sakurai et al. do not expressly disclose that the structure is less than 10 microns thick.

However, Silverbrook discloses a structure (overcoat 142) that is less than 10 microns thick (col. 9, lines 8-10), wherein nozzles are incorporated on the structure (Fig. 11).

At the time of invention, it would have been obvious to a person of ordinary skill in the art to utilize a structure incorporating nozzles that is less than 10 microns thick into the invention of Campbell et al. as modified by Sakurai et al. The motivation for doing so, as taught by Silverbrook, is to provide increased levels of protection against the air (col. 9, lines 5-8).

Claims 15, 18, 34, 37, 51, and 54 are rejected under 35 U.S.C. 103(a) as being unpatentable over Campbell et al. as modified by Sakurai et al., as applied to claim 1 above, and further in view of Kubby (US 5851412).

**Regarding claims 15, 34, and 51:**

**Campbell et al. as modified by Sakurai et al. disclose all the limitations of claim 1, and Campbell et al. also disclose that the printhead comprises a plurality of bubble forming chambers (col. 2, lines 48-53) each corresponding to a respective nozzle (Fig. 2)**

**Campbell et al. as modified by Sakurai et al. do not expressly disclose a plurality of heater elements are disposed within each bubble forming chamber, the heater elements within each bubble forming chamber being formed on different respective layers to one another.**

**However, Kubby discloses a plurality of heater elements (doped regions 20) disposed within a bubble forming chamber (Figs. 4 and 5), the heater elements within each bubble forming chamber being formed on different respective layers to one another (col. 4, line 66 – col. 5, line 10).**

**Therefore, at the time of invention, it would have been obvious to a person of ordinary skill in the art to utilize a plurality of heater elements formed on different layers within each bubble forming chamber, such as taught by Kubby, into the invention of Campbell et al. as modified by Sakurai et al. The motivation for doing so, as taught by Kubby, is to provide an ink jet ejector that is capable of emitting two distinct droplet sizes (col. 5, lines 11-21).**

**Regarding claims 18, 37, and 54:**

**Campbell et al. as modified by Sakurai et al. disclose all claimed limitations except that each heater element is covered on all sides with a conformal protective coating such that the coating of each heater element is seamless.**

**However, Kubby discloses heater elements that are covered on all sides with a conformal protective coating (protective layer of tantalum) such that the coating of each heater element is seamless (col. 4, lines 60-62 and Fig. 4).**

Art Unit: 2861

Examiner notes the additional limitation that the coating is applied substantially to all sides of the heater element simultaneously. However, the method of forming a device is not germane to the issue of patentability of the device itself. Therefore, this limitation has not been given patentable weight.

Therefore, at the time of invention, it would have been obvious to a person of ordinary skill in the art to utilize a seamless protective coating on all sides of the heater element, such as taught by Kubby, into the invention of Campbell et al. as modified by Sakurai et al. The motivation for doing so, as taught by Kubby, is to prevent corrosion of the semiconductor structures caused by contact with liquid ink (col. 4, lines 37-39).

Claims 17, 36, and 53 are rejected under 35 U.S.C. 103(a) as being unpatentable over Campbell et al. as modified by Sakurai et al., as applied to claim 1 above, and further in view of DeMoor et al.

Regarding claims 17, 36, and 53:

Campbell et al. as modified by Sakurai et al. disclose all claimed limitations except that the heater element is configured for a mass of less than two nanograms of the solid material of the heater element to be heated to a temperature above the boiling point to heat the bubble forming liquid to a temperature above the boiling point to cause the ejection of a drop.

However, DeMoor et al. disclose using a heater element of less than 2 nanograms (page 285, Fabrication: Ti thickness = 5nm; TiN thickness = 30nm; heater width = 2000 $\mu$ m; heater width = 0.4 $\mu$ m. Therefore, the volume of Ti within the heater is  $4 \times 10^{-12}$  cm<sup>3</sup>, and the volume of TiN within the heater is  $2.4 \times 10^{-11}$  cm<sup>3</sup>. Using the known densities of Ti = 4.54 g/cm<sup>3</sup> and TiN = 5.22 g/cm<sup>3</sup>, the heater element has an entire mass of 0.14344 ng).

Art Unit: 2861

Therefore, at the time of invention, it would have been obvious to a person of ordinary skill in the art to utilize a heater element of less than 2 nanograms, such as taught by DeMoor et al., into the invention of Campbell et al. as modified by Sakurai et al. The motivation for doing so, as taught by DeMoor et al., is that these types of heaters show excellent resistivity uniformity and a low TCR value (page 293, Conclusions).

### *Response to Arguments*

Applicant's arguments with respect to claim 1 have been considered but are moot in view of the new ground(s) of rejection. Please see the above combination, based on the disclosures provided by Campbell et al. and Sakurai et al., which teaches a heater element having a bubble nucleation section that is smaller in cross section than the rest of the heater element, so that the temperature of the bubble nucleation section is heated to above the boiling point before the rest of the heater element.

### *Conclusion*

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a).

Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to

Art Unit: 2861

37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Art Unit: 2861

*Communication with the USPTO*

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Shelby Fidler whose telephone number is (571) 272-8455. The examiner can normally be reached on M-F 8:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Matthew Luu can be reached on (571) 272-7663. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
